

CCP9 FISH Probe

Introduction

Chromosome counting probe 9 (CCP9) FISH Probe is designed to detect the copy number of chromosome 9 or to serve as a control to determine the relative number of copies of genes located on chromosome 9 or other chromosomes.

Intended Use

To measure the copy number of the human chromosome 9.

Cont.

CCP9 FISH Probe

Color

CytoGreen

Probe Design

The CCP9 probe hybridizes to chromosome 9 in both metaphase and interphase cells. After hybridizing with normal human peripheral blood lymphocyte samples, two distinct bright fluorescent spots could be observed in the interphase nuclei under a fluorescence microscope. In metaphase cells, bright signals can be observed on the pericentromeric regions around the centromere of chromosome 9. No cross-hybridization to loci on other chromosomes is observed.

Not to Scale

Cat. No.

CT-CCP009-10-G

Volume

10 Tests (100 µL)

Signal Pattern Interpretation

Normal Pattern

2G

Abnormal Pattern
