

LSP PPARG FISH Probe Cat No CT-LSP173

Locus Specific Probe for PPARG Gene

The PPARG FISH Probe is designed to detect the human *PPARG* gene located on chromosome band 3p25.2. *PPARG* is also known as *PPAR-gamma*, *NR1C3*, *PPARG1* or *PPARG2*.

The PPARG FISH probe is labeled with CytoGreen. CytoGreen is a fluorophore with an excitation peak at 495nm and emission peak at 518nm, giving it a green fluorescent signal with the appropriate filters.

The PPARG FISH probe hybridizes to chromosome 3 in both metaphase and interphase cells. After hybridizing with normal human peripheral blood lymphocyte samples, two distinct fluorescent spots are observed in the interphase nuclei, each spot corresponding to the 3p25.2 region on the chromosome 3. In metaphase cells, a “doublet” or “split signal” may appear on chromosomal region 3p25.2. Each signal within the doublet represents one of the two sister chromatids present in the replicated chromosome 3.
